Banking Transaction & Credit Risk Analytics

Executive case study | Synthetic portfolio dataset

Scope: 500 customers, 5,000 transactions, 350 loans. All figures describe a fictional bank; not industry benchmarks.

Executive scorecard

Metric	Value
Completed transaction rate	94.0%
Completed transaction fee revenue	$13,417.50
Loan outstanding exposure	$15,772,288.82
30+ DPD exposure	$3,625,165.36
30+ DPD exposure rate	22.98%

Loan exposure by product

Product	Loans	Exposure	30+ DPD exposure
Auto	112	$4,515,764.84	$1,126,222.92
Credit Card	131	$6,335,441.93	$1,237,627.98
Personal	107	$4,921,082.05	$1,261,314.46

Interpretation and recommendations

The modeled loan portfolio has a meaningful share of outstanding balance in the 30+ days-past-due category. Prioritize a drill-down by loan product and risk tier, validate data quality, and monitor changes over successive reporting snapshots before recommending policy changes. Transaction completion is high in the synthetic dataset; investigate incomplete transaction categories rather than assuming a cause.

Method and limitations

All metrics are computed from CSV extracts. Transaction volume is not bank revenue. Loan delinquency is a point-in-time exposure measure, not a default probability or charge-off rate. The synthetic data is not representative of a real bank, and no causal or fraud conclusions are warranted.
